

SHORT BIO. My research focuses on causal decision making (NeurIPS-25, Preprint, ICLR-26) and causal effect identification (NeurIPS-24). I study how to graphically model a wide range of real-world problems in a causal manner and make optimal decisions. In particular, my research explores methods for robust decision-making in settings where information about the environment is uncertain (NeurIPS-25), where there exist domain shifts between the training and deployment environments (Preprint), and even in decision-making scenarios based on counterfactual actions (ICLR-26).
